Pokémon Team Builder

PROJECT NAME

SquadUP!

GOAL

To simplify team building for Pokémon walkthroughs or competitive battling.

TYPE

Mobile App - Android - 360 × 800 px

TARGET AUDIENCE

Competitive Pokémon players & casual fans who plan teams on mobile before playthroughs or battles.

Problem Statement

- Existing team builders display browsing, editing, and stat analysis on a single cluttered screen, creating cognitive overload.
- Functions like adding a Pokémon and viewing its stats are entangled, forcing users to lose their current context mid-task.
- Different pages use different layouts and interactions — users must re-learn the interface each time they switch sections.
- Most team builders are desktop-first web tools. Tap targets are small, density is high, and flows are not touch-optimised.

Proposed Solution

- Assign each screen a single, exclusive function: browse, select, analyze, or manage. No overlap.
- Unified 3-tab bottom bar (Pokédex , My Team , Profile) provides consistent navigation across every screen.
- Progressive disclosure flow : Listing → Detail → Team Slot, so users always know where they are and what to do next.
- Mobile-native design at 360 × 800 px with touch-friendly tap targets and Pokémon pixel-art brand identity.

SquadUP! - App Showcase

UX Design Thinking Process

EMPATHIZE

Studied pain points of competitive Pokémon players using existing team builders like Showdown and Smogon.

DEFINE

Defined the core problem: functions like browsing, editing, and stat-checking overlap on a single screen.

IDEATE

Wireframed 7 screens each with exactly one purpose, establishing a linear, progressive disclosure flow.

DESIGN

Built high-fidelity Figma mockups at 360×800px with Pokémon pixel branding and reusable component system.

User Persona (DEFINE)

Ash Ketchum

Age: 20

Casual Pokemon Player

Mobile-first user

Pain Points

- Pokémon Showdown is powerful but intimidating for new players
- Checking base stats requires leaving the team builder entirely
- No clean mobile app that combines team builder + Pokédex stats

Goals

- Build a competitive team quickly on mobile, before a tournament
- View moves and stats without losing context from the team screen
- Fill type coverage gaps with clear, visual suggestions

Design Research (Qualitative)

Multi-function screens cause task abandonment

When browsing, editing, and stat analysis share a screen, users lose track of their original intent. Competitive players reported mid-task context loss as the most common frustration.

Context-switching is the #1 friction point

Players routinely tab between a team builder and a separate Pokédex to cross-check stats — a back-and-forth flow that SquadUP! resolves by integrating stats into the detail screen.

Mobile usability is neglected by existing tools

Most competitive tools are built for desktop browsers. On small screens, tap targets are undersized, information density is too high, and navigation is unclear.

Authentic branding builds trust with this audience

Pokémon players respond strongly to visual identity. An app that looks and feels like Pokémon — not just a generic utility — is perceived as more credible and worth using.

Competitor Analysis (Quantitative)

Feature	SquadUP!	Pokémon Showdown	Smogon Teambuilder	Serebii / Bulbapedia
Mobile-Optimised UI	✓	✗	✗	⚠
Dedicated Team Screen	✓	✓	✓	✗
Per-Pokémon Base Stats	✓	✓	⚠	✓
Type Coverage Analysis	✓	✓	✗	✗

Golisopod

#168

Bug Water

Hard Scale Pokémon

Height: 2.01 m
Weight: 108 kg

Description

The shell covering its body is as hard as diamond. This Pokémon will do anything it takes to win.

Weaknesses

Electric 2x Flying 2x Rock 2x

Resistances

Water 1/2x Ice 1/2x Fighting 1/2x
Ground 1/2x Steel 1/2x

Base Stats

HP 78

Locations

Sword Shield

Bridge Field, Giant's Mirror, Hammerlocke Hills, Motostoke Riverbank, Salar Mine No. 2, Courageous Gavern

Availability

Brilliant Diamond Shining Pearl Legends: Arceus

Not available in this game

Scarlet Violet Legends: 2-A

Location data not yet available

Key Takeaways

Single Responsibility Principle

Every screen in SquadUP! serves exactly one purpose. This single decision made the entire UX cohere — it eliminated every overlap and ambiguity downstream.

Separation of Concerns in UX

Browsing ≠ selecting ≠ managing ≠ analyzing. Keeping these flows distinct — and routing between them via the bottom nav — removed all mid-task context loss.

Consistent Visual Language Matters

Every screen in SquadUP! serves exactly one purpose. This single decision made the entire UX cohere — it eliminated every overlap and ambiguity downstream.

Component Systems Pay Off

Building reusable Pokémon cards, stat bar components, and pop-up overlays in Figma meant every iteration was faster and every screen stayed visually consistent.

Mobile-First Constraints Are an Asset

Designing at 360 × 800 px eliminated the temptation to overload a screen. Less real estate forced better, cleaner layout decisions at every step.
